Education

Dayananda Sagar College Of Engineering: Bachelor of Engineering in ***Computer Science and Engineering***

- Expected Graduation: Aug 2028
- CGPA: **8.6**/10.0 (current)

Skills

Languages: Java, JavaScript, TypeScript, Python
Backend & Web: Spring Boot, Node.js, Express, REST APIs, WebSocket, EJS
Databases: PostgreSQL, MongoDB, Neo4j, Redis, SQL
Tools: Git, Tableau, N8N

Projects

Vyomin – OSINT Platform for Geopolitical Event-Study Analytics July 2026 – Present

- **Tech Stack:** Java, Spring Boot, PostgreSQL, Neo4j, Redis, React, WebSocket
- Built a full-stack platform that tests whether geopolitical conflict events move stock prices, visualizing live GDELT event, market, and flight data on a React 3D globe and force-directed graph (WebSocket/STOMP, JWT + OAuth).
- Wrote an event-study engine to test whether geopolitical conflict events move stock prices: trading-calendar-correct forward returns, a **10,000-iteration bootstrap** for significance, and **Bonferroni correction** across dozens of event/country pairs.
- Caught and fixed two significance bugs: a pseudo-replication error that inflated **9 independent observations into a fake sample of 513**, and a saturation case that produced false positives when event coverage neared 100% – both verified by hand before the fix shipped.
- Built a multi-threaded ingestion pipeline for **4.35M GDELT records**, cutting a 14–17 hour sequential backfill to **79 minutes** with a worker pool; made it crash-safe with checkpointed resume, tested by killing the process mid-run.
- Split storage across PostgreSQL (analytics) and Neo4j (graph queries), and hid the market-data source behind a swappable client – so when Stooq began blocking automated traffic mid-build, moving to Yahoo Finance meant rewriting one class. Runs entirely on free-tier infrastructure.

Fincraft – Real-time Stock Sentiment & Progress Tracker Jun 2025 – Nov 2025

- **Tech Stack:** Node.js, Express, MongoDB, EJS, JavaScript, Tailwind CSS
- Built a full-stack stock sentiment and progress tracking app pulling live market data from the Finnhub API, with bcrypt-based authentication and a REST/MVC structure (models, views, controllers).
- Added `express-rate-limit` throttling to stay under Finnhub's **60 requests/minute** cap and protect the API key during heavy fetches.

JPMorgan Chase & Co. Software Engineering Job Simulation Oct 2025

- Built a Spring Boot REST controller with Kafka stream processing and an H2 in-memory store.

Competitive Programming

- **500+ problems solved** across platforms (LeetCode 150+, CodeChef 250+, Codeforces 100+)
- Max ratings: **LeetCode 1699**, **Codeforces 1307** (Pupil), **CodeChef 1624**

Volunteer Experience

DSIMUN (Model United Nations) Oct 2024 – Present

- Represented delegations in simulated UN committees, delivering opening statements and arguing country positions live in front of the full committee through moderated and unmoderated caucuses.
- Researched foreign policy, voting history, and past resolutions to build each country's stance, then defended it under cross-questioning and shifting debate.
- Negotiated with other delegates to build coalitions and drafted resolutions under committee deadlines.
